,2015 The intent of the Multi Material Lightweight Vehicle MMLV was to assess the feasibility of achieving a significant level of vehicle mass reduction enabling engine downsizing resulting in a tangible fuel reduction and environmental benefit The MMLV project included the development of two 2 lightweight vehicle designs referred to as Mach I and Mach II MMLV variants based on a 2013 Ford production C D segment production vehicle Fusion Weight comparison life cycle assessment and limited full vehicle testing are included in the project scope The Mach I vehicle variant was comprised of materials and processes that are commercially available or previously demonstrated The 363 kg mass reduction associated with the Mach I design enabled use of a one liter three cylinder gasoline turbocharged direct injection engine maintaining the performance and utility of the baseline vehicle The full MMLV project produced seven 7 MMLV Mach I concept vehicles which were used for testing and evaluation The full vehicle tests confirmed that MMLV Mach I concept vehicle performed approximately equivalent to the baseline 2013 Ford Fusion vehicle thereby validating the design of the multi material lightweight vehicle design The results of the Life Cycle Assessment conducted by third party consultant indicated that if the MMLV Mach I design was built and operated in North America for 250 000 km 155 343 miles it would produce significant environmental and fuel economy benefits including a 16% reduction in Global Warming Potential GWP and 16% reduction in Total Primary Energy TPE The LCA calculations estimated the combined fuel economy of 34 mpg 6 9 l 100 km associated with the MMLV Mach I Design compared to 28 mpg 8 4 l 100 km for the 2013 Ford Fusion

Environmental Risks and Challenges of Anthropogenic Metals Flows and Cycles E. van der Voet,2013 A key

question that relates to the very broad and intensive use of metals is whether society needs to be concerned about long term supplies of any or many of them This is a many faceted question that cannot be answered quickly or unequivocally To address it the Global Metal Flows Working Group envisions a series of six reports of which this is the third one addressing environmental risks and challenges of anthropogenic metals flows and cycles This report compiled by a group of international experts focuses on the impact of metals on the environment as well as on their life cycle energy use Currently primary metals production is responsible for 7 8% of the total global energy use as well as for severe local environmental impacts The report suggests to apply best available techniques and to increase recycling of metals which not only requires significantly less energy per kg metal produced than primary production but also helps decreasing the overall local impacts of mining However even if recycling rates are increased rising global demand for many metals will remain a huge environmental challenge in the next decades worldwide Page 4 of cover

Metal Recycling, 2013 Metal recycling is a complex business that is becoming increasingly difficult Recycling started long ago when people realized that it was more resource and cost efficient than just throwing away the resources and starting all over again In this report we discuss how to increase metal recycling rates and thus resource

efficiency from both quantity and quality viewpoints The discussion is based on data about recycling input and the technological infrastructure and worldwide economic realities of recycling Decision makers set increasingly ambitious targets for recycling but far too much valuable metal today is lost because of the imperfect collection of end of life EoL products improper practices or structural deficiencies within the recycling chain which hinder achieving our goals of high resource efficiency and resource security and of better recycling rates
