Aggarwal,2015-01-29 In this book clinicians and basic scientists from USA India and other countries discuss the rationales and clinical experiences with targeted approaches to treat prevent or manage cancer Cancer is a hyperproliferative disorder that is regulated by multiple genes and multiple cell signaling pathways Genomics proteomics and metabolomics have revealed that dysregulation of dozens of genes and their products occur in any given cell type that ultimately leads to cancer These discoveries are providing unprecedented opportunities to tackle cancer by multi faceted approaches that target these underpinnings This book emphasizes a multi targeted approach to treating cancer the focus of the 5th International Conference on Translational Cancer Research that was held in Vigyan Bhawan Delhi India from Feb 6 9 2014

Computational and Experimental Approaches in Multi-target Pharmacology Thomas J. Anastasio,2017-08-24 The next frontier in pharmacology is the development of multi target strategies in which pathological processes are controlled by pharmacologically manipulating them at many different points at once Designing multi target strategies will require deep understanding of the complex physiology that underlies pathological processes It will also require the development of single drugs with multiple targets or combinations of drugs with compatible pharmacokinetics that work synergistically to maximize desirable effects while minimizing unwanted side effects This e Book contains ten original articles each addressing a different aspect of this challenge Together they open new perspectives and show the way forward in the development of multi target therapeutics

Designing Multi-Target Drugs J. Richard Morphy,C John Harris,2012-03-28 Multi target drug discovery MTDD is an emerging area of increasing interest to the drug discovery community Drugs that modulate several targets have the potential for an improved balance of efficacy and safety compared to single targets agents Although there are a number of marketed drugs that are thought to derive their therapeutic benefit by virtue of interacting with multiple targets the majority of these were discovered accidentally Written by world renowned experts this is the first book to gather together knowledge and experiences of the rational discovery of multi target drugs It describes the current state of the art the achievements and the challenges of the field and importantly the lessons learned by researchers to date and their application to future MTDD

Multi-targeted Tyrosine Kinase Inhibitors in the Treatment of Cancer and Neurodegenerative Disorders Halilibrahim Ciftci,Belgin Sever,Luciano Saso,Rumiana Tzoneva,Valentina Onnis,2024-08-07 Tyrosine kinases which catalyze the transfer of a phosphate from ATP to a hydroxyl group of a tyrosine residue play a plethora of roles in the regulation of diverse functions in normal cells including cell growth motility differentiation and metabolism Moreover they are also associated with oncogenesis Tyrosine kinases are mainly classified as receptor tyrosine kinases and non receptor tyrosine kinases including crucial members Epidermal growth factor receptor EGFR belongs to the ERBB family of receptor tyrosine kinases along with three other closely related receptors namely HER 2 HER 3 and HER 4 EGFR and HER 2 lead to autophosphorylation of the intracellular domain through tyrosine kinase activity and subsequent stimulation of downstream cascade that may result in proliferation suppression of apoptosis metastasis and angiogenesis On the other hand c Abl Abl 1 is a non receptor tyrosine kinase which is also essential in the regulation of several antiapoptotic and proliferative signal transduction pathways They have mainly been identified as important targets for several types of cancer such as EGFR for non small cell lung cancer glioma and colorectal cancer HER 2 for breast and colorectal cancers and Abl for chronic myeloid leukemia One of the major platforms that they have participated in is neurodegenerative disorders such as Parkinson s disease Alzheimer s disease and amyotrophic lateral sclerosis Aberrant activity of tyrosine kinases in particular EGFR and Abl have been reported to induce apoptosis and cell cycle arrest in response to a wide range of stimuli resulting in neurodegeneration and neuroinflammation The main goal of this Research Topic is to identify new and potent effective tyrosine kinase inhibitors to be effective in cancer and neurodegenerative disorders
