An Introduction to Multilevel Modeling Techniques Ronald Heck, Scott L. Thomas, 2020-03-24. Multilevel modelling is a data analysis method that is frequently used to investigate hierarchical data structures in educational, behavioural, health and social sciences disciplines. Multilevel data analysis exploits data structures that cannot be adequately investigated using single level analytic methods such as multiple regression, path analysis and structural modelling. This text offers a comprehensive treatment of multilevel models for univariate and multivariate outcomes. It explores their similarities and differences and demonstrates why one model may be more appropriate than another given the research objectives. New to this edition: An expanded focus on the nature of different types of multilevel data structures e.g. cross sectional, longitudinal, cross classified etc. for addressing specific research goals. Varied modelling methods for examining longitudinal data including random effect and fixed effect approaches. Expanded coverage illustrating different model building sequences and how to use results to identify possible model improvements. An expanded set of applied examples used throughout the text. Use of four different software packages i.e. Mplus, R, SPSS, Stata with selected examples of model building input files included in the chapter appendices and a more complete set of files available online. This is an ideal text for graduate courses on multilevel longitudinal latent variable modelling, multivariate statistics or advanced quantitative techniques taught in psychology, business, education, health and sociology. Recommended prerequisites are introductory univariate and multivariate statistics.

D-scoring Method of Measurement Dimitar Dimitrov, 2023-07-18. D scoring Method of Measurement presents a unified framework of classical and latent measurement referred to as D scoring method of measurement (DSM). Provided are detailed descriptions of DSM procedures and illustrative examples of how to apply the DSM in various scenarios of measurement. The DSM is designed to combine merits of the traditional CTT and IRT for the purpose of transparency, ease of interpretations, computational simplicity of test scoring and scaling and practical efficiency particularly in large scale assessments. Through detailed descriptions of DSM procedures, this

book shows how practical applications of such procedures are facilitated by the inclusion of operationalized guidance for their execution using the computer program DELTA for DSM based scoring equating and item analysis of test data In doing so the book shows how DSM procedures can be readily translated into computer source codes for other popular software packages such as R D scoring Method of Measurement equips researchers and practitioners in the field of educational and psychological measurement with a comprehensive understanding of the DSM as a unified framework of classical and latent scoring equating and psychometric analysis
