Ordinal Data Analysis Nairanjana Dasgupta, Jillian Morrison, 2024-06-04 This book is a step by step data story for analyzing ordinal data from start to finish The book is for researchers statisticians and scientists who are working with datasets where the response is ordinal This type of data is common in many disciplines not just in surveys as is often thought For example in the biological sciences there is an interest in understanding and predicting the growth stage of a plant or animal based on a multitude of factors Likewise ordinal data is common in environmental sciences for example stage of a storm chemical sciences for example type of reaction physical sciences for example stage of damage when force is applied medical sciences for example degree of pain and social sciences for example demographic factors like social status categorized in brackets There has been no complete text about how to model an ordinal response as a function of multiple numerical and categorical predictors There has always been a reluctance and reticence towards ordinal data as it lies in a no man s land between numerical and categorical data Examples from health sciences are used to illustrate in detail the process of how to analyze ordinal data from exploratory analysis to modeling to inference and diagnostics This book also shows how Likert type analysis is often used incorrectly and discusses the reason behind it Similarly it discusses the methods related to Structural Equations and talks about appropriate uses of this class of methods The text is meant to serve as a reference book and to be a how to resource along with the why and when for modeling ordinal data Key Features Includes applications of the statistical theory Includes illustrated examples with the associated R and SAS code Discusses the key differences between the different methods that are used for ordinal data analysis Bridges the gap between methods for ordinal data analysis used in different disciplines

Educational Policy Evaluation through International Comparative Assessments Rolf Strietholt, Wilfried Bos, Jan-Eric Gustafsson, Monica Rosén, 2014 One of the most salient findings from the field of education is that there are huge national differences in student achievement as shown in international comparative studies like PISA and TIMSS The shockingly large gap between the highest performing countries mostly in East Asia and many European countries corresponds to a difference in attainment of two years of schooling Although this finding has been replicated in several studies the reasons for and consequences of such differences are currently not well understood This book is a collection of essays and studies by leading experts in international comparative education who demonstrate how international comparative assessments can be used to evaluate educational policies The volume is organized into two parts that address first theoretical foundations and methodological developments in the field of international assessments and second innovative substantive studies that utilize international data for policy evaluation studies The intention of this book is to revisit the idea of using the world as an educational laboratory both to inform policy and to facilitate theory development

Preparing for Life in a Digital Age Julian Fraillon, John Ainley, Wolfram Schulz, Tim Friedman, Eveline

Gebhardt, 2014-12-13 Ability to use information and communication technologies ICT is an imperative for effective participation in today's digital age. Schools worldwide are responding to the need to provide young people with that ability. But how effective are they in this regard? The IEA International Computer and Information Literacy Study (ICILS) responded to this question by studying the extent to which young people have developed computer and information literacy (CIL), which is defined as the ability to use computers to investigate, create and communicate with others at home, school, the workplace and in society. The study was conducted under the auspices of the International Association for the Evaluation of Educational Achievement (IEA) and builds on a series of earlier IEA studies focusing on ICT in education. Data were gathered from almost 60,000 Grade 8 students in more than 3,300 schools from 21 education systems. This information was augmented by data from almost 35,000 teachers in those schools and by contextual data collected from school ICT coordinators, school principals and the ICILS national research centers. The IEA ICILS team systematically investigated differences among the participating countries in students' CIL outcomes, how participating countries were providing CIL-related education and how confident teachers were in using ICT in their pedagogical practice. The team also explored differences within and across countries with respect to relationships between CIL education outcomes and student characteristics and school contexts. In general, the study findings presented in this international report challenge the notion of young people as digital natives with a self-developed capacity to use digital technology. The large variations in CIL proficiency within and across the ICILS countries suggest it is naive to expect young people to develop CIL in the absence of coherent learning programs. Findings also indicate that system and school level planning needs to focus on increasing teacher expertise in using ICT for pedagogical purposes if such programs are to have the desired effect. The report furthermore presents an empirically derived scale and description of CIL learning that educational stakeholders can reference when deliberating about CIL education and use to monitor change in CIL over time.
